DESCRIPTION OF THE ACTIVITY (including all job steps)

Coating substances onto metal surfaces and onto glass using an artist spray brush. Firstly, all the solution samples of specific concentration of nanoparticles in solvent (water) were prepared and stored overnight in their respective sample bottles or in beakers sealed with nesco film. Conductive glass as well as normal glass were cut into desired sizes for use. Stainless steel square sheets were also prepared. Gloves, goggles, a lab coat and a face mask were worn at all times during this experiment.

Secondly, the fume hood was prepared by placing down paper towels and old newspapers throughout to contain any spillages or mess caused. The artist brush equipment was set up with ease and the sample vial was filled with the sample solution and connected to the spray brush. The spray brush was then connected to an air supply. A hot plate was left to heat up to the desired temperature at which the sample solution that is sprayed onto the surface coated efficiently enough. The fume hood was switched off while the spraying of the sample solution onto the material's surface occurred.

Once finished, the fume hood was switched on. The coated glass and metal squares were left to cool and dry to some extent. They were then placed into the oven to sinter at around 400°C for half an hour. Whilst that was taking place, the hot plate was cleaned with care as it was still hot. The spray brush itself was cleaned by spraying out the sample until only air was sprayed. Deionised water was then sprayed followed by the spraying of a specialised cleaning solution to fully clean the spray for use with the next sample solution. The next sample solution was prepared and the procedure above was repeated.

The coated glass plate was sintered in an oven for 15-20 minutes at 450°C, and left to cool down afterwards for an hour. A sensitizing dye solution is prepared to dip the coated glass plate into, where either an artificial dye solid or a natural dye from the crushing of frozen berries is used.

The artificial dye is dissolved into a solution of methanol in a beaker and stirred for an hour. Glass plate is placed into the dye solution and left for 4-8 hours in the absence of sunlight and air.

Another glass plate was coated with platinum particles. Iodine solution was used as an electrolyte, which was placed in between the two glass plates (anode and cathode) in order to complete the circuit. Bulldog clips were used to hold the cell in place and to produce an open-vessel solar cell. Superglue was also used as glue as well as a spacer in order to create a closed-vessel solar cell.

| SUMMARY OF ADDITIONAL ACTIONS | | | |
|-------------------------------|---------|-------------|----------------|
| Action to be taken | By whom | Target date | Date completed |
| N/A. | | | |

| Name and signature of assessor: | Date: |
|---|------------|
| Name and signature of Head of Department: N/A. | Date: N/A. |
| For students: name and signature of supervisor: | Date: |

COSHH RISK ASSESSMENT

| REVIEW OF ASSESSMENT | | | | |
|--|------------------------------------|---|--------------------|--------------|
| Date: | Name(s) and signature(s) of | Outcome of review (eg no change, minor changes, new assessment, | | |
| | reviewer(s) | work stopped) | | |
| N/A | | N/A | | |

| Other: X (specify): Lab coat | | |
| Specify grade, type etc: | | |
| EMERGENCY PROCEDURES (if any substance and/or procedure identified overleaf are likely to | | |
| pose a special hazard in an emergency, then describe any special information for those dealing with it.) | | |
| | | |
| Special hazard: N/A | | |
| | | |
| FIRST AID & OTHER | | |
| N/A | | |
| SPILLAGE (indicate if used) | | |
| Method: Neutralise/dilute : Mop-up ; Disinfectant ; Spillage kit X ; | | |
| Other (describe) | | |
| Personal Protective Equipment: hands X ; face X ; body X ; none | | |
| | | |
| DISPOSAL OF WASTE (indicate if used) | | |
| Autoclave: ; Yellow bag: X; Chemical waste: ; Drain: X; No hazard: | | |

Notes: Blue roll tissue paper is laid on and around the area to which spray coating will be carried out. Hot plate will be cleaned with D.I. water in order to remove any nanoparticles sprayed onto it when the hot plate is at room temperature.

ASSESSMENT (Are the existing precautions adequate? If not, why not? Attach additional sheets if necessary)

Yes.
